

SUMMARY OF PRODUCT CHARACTERISTICS

1. Name of the Medicinal Product

1.1 Product Name:

Pardopa

1.2 Strength:

250mg/25mg

2. Quality and Quantitative Composition

Each uncoated tablet contains:

Levodopa BP 250mg

Carbidopa BP equivalent to anhydrous Carbidopa 25mg

3. Pharmaceutical Form

Tablet

4. Clinical Particulars

4.1 Therapeutic indications:

Antiparkinsonian agent

For treatment of Parkinson's disease and syndrome

4.2 Posology and method of administration:

To be taken orally.

The optimum daily dosage must be determined by careful titration in each patient.

These Tablets are available in a ratio of 4:1 or 10:1 of levodopa to carbidopa to provide facility for fine dosage titration for each patient.

General Considerations

Studies show that the peripheral dopa-decarboxylase is fully inhibited (saturated) by carbidopa at doses between 70 and 100 mg a day. Patients receiving less than this amount of carbidopa are more likely to experience nausea and vomiting.

Standard antiparkinsonian drugs, other than levodopa alone, may be continued while 'Levodopa and Carbidopa' is being administered, although their dosage may have to be adjusted.

Because both therapeutic and adverse effects are seen more rapidly with 'Levodopa and Carbidopa' than with levodopa, patients should be carefully monitored during the dosage adjustment period. Involuntary movements, particularly blepharospasm, are a useful early sign of excess dosage in some patients.

Patients not receiving levodopa

Dosage may be best initiated with one tablet 100/25 mg' three times a day. This dosage schedule provides 75 mg of carbidopa per day. Dosage may be increased by one tablet of 'Levodopa and Carbidopa 50mg/12.5 mg or every day or every other day, as necessary, until a dosage equivalent of eight tablets of 100/25 mg' a day is reached.

If 'Levodopa and Carbidopa 100 mg/10 mg Tablets' or 'Levodopa and Carbidopa 50/12.5 mg Tablets' are used, dosage may be initiated with one tablet three or four times a day. Titration upward may be required in some patients to achieve optimum dosage of carbidopa. The dosage may be increased by one tablet every day or every other day until a total of eight tablets (two tablets q.d.s.) is reached.

Response has been observed in one day, and sometimes after one dose. Fully effective doses usually are reached within seven days as compared to weeks or months with levodopa alone.

'Levodopa and Carbidopa 50/12.5mg Tablets' or 'Levodopa and Carbidopa 100 mg/10 mg Tablets' may be used to facilitate dosage titration according to the needs of the individual patient.

Patients receiving levodopa

Discontinue levodopa at least 12 hours (24 hours for slow-release preparations) before starting therapy with 'Levodopa and Carbidopa'. The easiest way to do this is to give 'Levodopa and Carbidopa' as the first morning dose after a night without any levodopa. The dose of 'Levodopa and Carbidopa' should be approximately 20% of the previous daily dosage of levodopa.

Patients taking less than 1,500 mg levodopa a day should be started on one tablet of 'Levodopa and Carbidopa Plus 100/25mg ' three or four times a day dependent on patient need. The suggested starting dose for most patients taking more than 1,500 mg levodopa a day is one tablet of 'Levodopa and Carbidopa 250 mg/25 mg' three or four times a day.

Maintenance

Therapy with 'Levodopa and Carbidopa' should be individualized and adjusted gradually according to response. When a greater proportion of carbidopa is required, each tablet of 'Levodopa and Carbidopa 100 mg/10 mg' may be replaced with a tablet of 100/25 mg ' or 'Levodopa and Carbidopa 50/12.5 mg'.

When more levodopa is required, 'Levodopa and Carbidopa 250/25 mg Tablets' should be substituted at a dosage of one tablet three or four times a day. If necessary, the dosage of 'Levodopa and Carbidopa 250 mg/25 mg Tablets' may be increased by one tablet every day or every other day to a maximum of eight tablets a day. Experience with a total daily dosage greater than 200 mg carbidopa is limited.

Patients receiving levodopa with another decarboxylase inhibitor

When transferring a patient to 'Levodopa and Carbidopa' from levodopa combined with another decarboxylase inhibitor, discontinue dosage at least 12 hours before 'Levodopa and Carbidopa' is started. Begin with a dosage of 'Levodopa and Carbidopa' that will provide the same amount of levodopa as contained in the other levodopa/decarboxylase inhibitor combination.

Patients receiving other antiparkinsonian agents

Current evidence indicates that other antiparkinsonian agents may be continued when 'Levodopa and Carbidopa' is introduced, although dosage may have to be adjusted in line with manufacturers' recommendations.

Use in children

The safety of 'Levodopa and Carbidopa' in patients under 18 years of age has not been established and its use in patients below the age of 18 is not recommended.

Use in the elderly

There is wide experience in the use of this product in elderly patients. The recommendations set out above reflect the clinical data derived from this experience.

4.3 Contraindications:

Non-selective monoamine oxidase (MAO) inhibitors are contraindicated for use with 'Levodopa and Carbidopa'. These inhibitors must be discontinued at least two weeks before starting 'Levodopa and Carbidopa'. It may be administered concomitantly with the manufacturer's recommended dose of an MAO inhibitor with selectivity for MAO type B (e.g. Selegiline hydrochloride).

It is contraindicated in patients with narrow-angle glaucoma and in patients with known hypersensitivity to any component of this medication.

Since levodopa may activate a malignant melanoma, it should not be used in patients with suspicious undiagnosed skin lesions or a history of melanoma.

4.4 Special warning and precautions:

It is not recommended for the treatment of drug-induced extrapyramidal reactions.

It should be administered cautiously to patients with severe cardiovascular or pulmonary disease, bronchial asthma, renal, hepatic or endocrine disease, or history of peptic ulcer disease (because of the possibility of upper gastro-intestinal hemorrhage).

Care should be exercised when it is administered to patients with a history of myocardial infarction who have residual atrial nodal or ventricular arrhythmias. Cardiac function should be monitored with particular care in such patients during the period of initial dosage adjustment.

Levodopa has been associated with somnolence and episodes of sudden sleep onset. Sudden onset of sleep during daily activities, in some cases without awareness or warning signs, has been reported very rarely. Patients must be informed of this and advised to exercise caution while driving or operating machines during treatment with levodopa. Patients who have experienced somnolence and/or an episode of sudden sleep onset must refrain from driving or operating machines. Furthermore a reduction of dosage or termination of therapy may be considered.

All patients should be monitored carefully for the development of mental changes, depression with suicidal tendencies, and other serious antisocial Behaviour. Patients with current psychoses should be treated with caution.

Dyskinesias may occur in patients previously treated with levodopa alone because carbidopa permits more levodopa to reach the brain and, thus, more dopamine to be formed. The occurrence of dyskinesias may require dosage reduction.

As with levodopa, it may cause involuntary movements and mental disturbances. Patients with a history of severe involuntary movements or psychotic episodes when treated with levodopa alone should be observed carefully when it is substituted. These reactions are thought to be due to increased brain dopamine following administration of levodopa, and use of 'Levodopa and Carbidopa' may cause a recurrence. A syndrome resembling the neuroleptic malignant syndrome

SUMMARY OF PRODUCT CHARACTERISTICS**PARDOPA-275 (LEVODOPA BP 250 mg AND CARBIDOPA BP 25 mg TABLETS)**

including muscular rigidity, elevated body temperature, mental changes and increased serum creatine phosphokinase has been reported with the abrupt withdrawal of antiparkinsonian agents. Therefore, any abrupt dosage reduction or withdrawal of 'Levodopa and Carbidopa' should be carefully observed, particularly in patients who are also receiving neuroleptics.

Impulse control disorders

Patients should be regularly monitored for the development of impulse control disorders. Patients and caregivers should be made aware that behavioral symptoms of impulse control disorders including pathological gambling, increased libido, hyper sexuality, compulsive spending or buying, binge eating and compulsive eating can occur in patients treated with dopamine agonists and/or other dopaminergic treatments containing levodopa including Levodopa and Carbidopa. Review of treatment is recommended if such symptoms develop.

Concomitant administration of psycho-active drugs such as phenothiazines or butyrophenones should be carried out with caution, and the patient carefully observed for loss of antiparkinsonian effect. Patients with a history of convulsions should be treated with caution.

As with levodopa, periodic evaluations of hepatic, hematopoietic, cardiovascular and renal function are recommended during extended therapy.

Patients with chronic wide-angle glaucoma may be treated cautiously with 'Levodopa and Carbidopa', provided the intra-ocular pressure is well controlled and the patient monitored carefully for changes in intra-ocular pressure during therapy.

If general anesthesia is required, therapy with 'Levodopa and Carbidopa' may be continued for as long as the patient is permitted to take fluids and medication by mouth. If therapy has to be stopped temporarily, 'Levodopa and Carbidopa' may be restarted as soon as oral medication can be taken at the same daily dosage as before.

Epidemiological studies have shown that patients with Parkinson's disease have a higher risk of developing melanoma than the general population (approximately 2-6 fold higher). It is unclear whether the increased risk observed was due to Parkinson's disease, or other factors such as drugs used to treat Parkinson's disease. Therefore patients and providers are advised to monitor for melanomas on a regular basis when using 'Levodopa and Carbidopa' for any indication.

Ideally, periodic skin examinations should be performed by appropriately qualified individuals (e.g., dermatologists).

Laboratory Tests

Commonly, levels of blood urea nitrogen, creatinine, and uric acid are lower during administration of 'Levodopa and Carbidopa' than with levodopa. Transient abnormalities include elevated levels of blood urea, AST (SGOT), ALT (SGPT), LDH, bilirubin, and alkaline phosphatase.

Decreased hemoglobin, haematocrit, elevated serum glucose and white blood cells, bacteria and blood in the urine have been reported.

Positive Coombs' tests have been reported, both with 'Levodopa and Carbidopa' and levodopa alone.

'Levodopa and Carbidopa' may cause a false positive result when a dipstick is used to test for urinary ketone; and this reaction is not altered by boiling the urine. The use of glucose oxidase methods may give false negative results for glycosuria.

4.5 Interactions with Other Medicaments

Caution should be exercised when the following drugs are administered concomitantly with 'Levodopa and Carbidopa'.

Antihypertensive agents

Postural hypotension can occur when 'Levodopa and Carbidopa' is added to the treatment of patients already receiving antihypertensive drugs. Dosage adjustment of the antihypertensive agent may be required.

Antidepressants

Rarely, reactions including hypertension and dyskinesia have been reported with the concomitant use of tricyclic antidepressants.

Anticholinergic

Anticholinergic may affect the absorption and thus the patient's response.

Iron

Studies demonstrate a decrease in the bioavailability of carbidopa and/or levodopa when it is ingested with ferrous sulphate or ferrous gluconate.

Other drugs

To date there has been no indication of interactions that would preclude concurrent use of standard antiparkinsonian drugs.

Dopamine D₂ receptor antagonists (e.g. phenothiazines, butyrophenones, and Risperidone) and isoniazid, may reduce the therapeutic effects of levodopa. The beneficial effects of levodopa in Parkinson's disease have been reported to be reversed by phenytoin and papaverine. Patients taking these drugs with 'Levodopa and Carbidopa' should be carefully observed for loss of therapeutic response.

Use of 'Levodopa and Carbidopa' with dopamine-depleting agents (e.g., tetrabenazine) or other drugs known to deplete monoamine stores is not recommended.

Concomitant therapy with Selegiline and carbidopa-levodopa may be associated with severe orthostatic hypotension not attributable to carbidopa-levodopa alone

Since levodopa competes with certain amino acids, the absorption of 'Levodopa and Carbidopa' may be impaired in some patients on a high protein diet.

The effect of simultaneous administration of antacids with 'Levodopa and Carbidopa' on the bioavailability of levodopa has not been studied.

'Levodopa and Carbidopa' may be given to patients with Parkinson's disease and syndrome who are taking vitamin preparations that contain pyridoxine hydrochloride (Vitamin B6).

**4.6 Pregnancy and lactation:*****Pregnancy***

Although the effects of 'Levodopa and Carbidopa' on human pregnancy are unknown, both levodopa and combinations of carbidopa and levodopa have caused visceral and skeletal malformations in rabbits. Therefore, the use of 'Levodopa and Carbidopa' in women of childbearing potential requires that the anticipated benefits of the drug be weighed against possible hazards should pregnancy occur.

Lactation

It is not known whether carbidopa is excreted in human milk. In a study of one nursing mother with Parkinson's disease, excretion of levodopa in human breast milk was reported. Because many drugs are excreted in human milk and because of the potential for serious adverse reactions in infants, a decision should be made whether to discontinue breast-feeding or discontinue the use of 'Levodopa and Carbidopa', taking into account the importance of the drug to the mother.

4.7 Effects on ability to drive and use machine:

Individual responses to medication may vary and certain side effects that have been reported with 'Levodopa and Carbidopa' may affect some patients' ability to drive or operate machinery. Patients treated with levodopa and presenting with somnolence and/or sudden sleep episodes must be informed to refrain from driving or engaging in activities where impaired alertness may put themselves or others at risk of serious injury or death (e.g. operating machines), until such recurrent episodes and somnolence have resolved.

4.8 Undesirable effects:

Side effects that occur frequently with 'Levodopa and Carbidopa' are those due to the central neuropharmacological activity of dopamine. These reactions can usually be diminished by dosage reduction. The most common are dyskinesia including choreiform, dystonic and other involuntary movements and nausea. Muscle twitching and blepharospasm may be taken as early signs to consider dosage reduction.

PARDOPA-275 (LEVODOPA BP 250 mg AND CARBIDOPA BP 25 mg TABLETS)

Other side effects reported in clinical trials or in post-marketing experience include:

Body as a whole: syncope, chest pain, anorexia.

Cardiovascular: cardiac irregularities and/or palpitations, orthostatic effects including hypotensive episodes, hypertension, phlebitis.

Gastro-intestinal: vomiting, gastro-intestinal bleeding, development of duodenal ulcer, diarrhoea, dark saliva.

Hematologic: leucopenia, haemolytic and non-haemolytic anemia, thrombocytopenia, agranulocytosis.

Hypersensitivity: angioedema, urticaria, pruritus, Henoch-Schonlein purpura.

Nervous System/Psychiatric: neuroleptic malignant syndrome, Brady kinetic episodes (the “on-off” phenomenon), dizziness, paraesthesia, psychotic episodes including delusions, hallucinations and paranoid ideation, depression with or without development of suicidal tendencies, dementia, dream abnormalities, agitation, confusion, increased libido. Levodopa is associated with somnolence and has been associated very rarely with excessive daytime somnolence and sudden sleep onset episodes.

Respiratory: dyspnoea.

Skin: alopecia, rash, dark sweat.

Urogenital: dark urine.

Rarely convulsions have occurred; however, a causal relationship with 'Levodopa and Carbidopa' has not been established.

Other side effects that have been reported with levodopa or levodopa/carbidopa combinations and may be potential side effects with 'Levodopa and Carbidopa' include:

Gastro-intestinal: dyspepsia, dry mouth, bitter taste, sialorrhea, dysphagia, bruxism, hiccups, abdominal pain and distress, constipation, flatulence, burning sensation of the tongue.

Metabolic: weight gain or loss, oedema.

Nervous System/Psychiatric: asthenia, decreased mental acuity, disorientation, ataxia, numbness, increased hand tremor, muscle cramp, trismus, activation of latent Horner's syndrome, insomnia, anxiety, euphoria, falling and gait abnormalities.

Impulse control disorders

Pathological gambling, increased libido, hyper sexuality, compulsive spending or buying, binge eating and compulsive eating can occur in patients treated with dopamine agonists and/or other dopaminergic treatments containing levodopa including Levodopa and Carbidopa

Skin: flushing increased sweating.

Special senses: diplopia, blurred vision, dilated pupils, oculogyric crises.

Urogenital: urinary retention, urinary incontinence, priapism.

Miscellaneous: weakness, faintness, fatigue, headache, hoarseness, malaise, hot flushes, sense of stimulation, bizarre breathing patterns, malignant melanoma.

4.9 Overdose:

Treatment

Management of acute over dosage with 'Levodopa and Carbidopa' is basically the same as management of acute over dosage with levodopa; however pyridoxine is not effective in reversing the actions of 'Levodopa and Carbidopa'. ECG monitoring should be instituted, and the patient carefully observed for the possible development of arrhythmias; if required, appropriate anti-arrhythmic therapy should be given. The possibility that the patient may have taken other drugs as well as 'Levodopa and Carbidopa' should be taken into consideration. To date, no experience has been reported with dialysis, and hence its value in the treatment of over dosage is not known.

The terminal half-life of levodopa is about two hours in the presence of carbidopa.

5. Pharmacological Properties

5.1 Pharmacodynamic Properties:

Levodopa is a precursor of dopamine, and is given as replacement therapy in Parkinson's disease. Carbidopa is a peripheral dopa decarboxylase inhibitor. It prevents metabolism of levodopa to dopamine in the peripheral circulation, ensuring that a higher proportion of the dose reaches the brain, where dopamine acts. A lower dose of levodopa can be used, reducing the incidence and severity of side effects.

**PARDOPA-275 (LEVODOPA BP 250 mg AND CARBIDOPA BP 25 mg TABLETS)**

'Levodopa and Carbidopa' is useful in relieving many of the symptoms of Parkinsonism, particularly rigidity and bradykinesia. It is frequently helpful in the management of tremor, dysphagia, sialorrhea, and postural instability associated with Parkinson's disease and syndrome. When response to levodopa alone is irregular, and signs and symptoms of Parkinson's disease are not controlled evenly throughout the day, substitution of 'Levodopa and Carbidopa' usually reduces fluctuations in response. By reducing some of the adverse reactions produced by levodopa alone, 'Levodopa and Carbidopa' permits more patients to obtain adequate relief from the symptoms of Parkinson's disease.

5.2 Pharmacokinetic Properties:***Absorption***

Carbidopa reduces the amount of levodopa required to produce a given response by about 75% and, when administered with levodopa, increases both plasma levels and the plasma half-life of levodopa, and decreases plasma and urinary dopamine and homovanilic acid.

Distribution

The plasma half-life of levodopa is about 50 minutes, without carbidopa. When carbidopa and levodopa are administered together, the half-life of levodopa is increased to about 1.5 hours. At steady state, the bioavailability of carbidopa from Levodopa and Carbidopa tablets is approximately 99% relative to the concomitant administration of carbidopa and levodopa.

Metabolism and Elimination

In clinical pharmacologic studies, simultaneous administration of carbidopa and levodopa produced greater urinary excretion of levodopa in proportion to the excretion of dopamine than administration of the two drugs at separate times.

Pyridoxine hydrochloride (vitamin B6), in oral doses of 10 mg to 25 mg, may reverse the effects of levodopa by increasing the rate of aromatic amino acid decarboxylation. Carbidopa inhibits this action of pyridoxine; therefore, Levodopa and Carbidopa can be given to patients receiving supplemental pyridoxine (vitamin B6).

5.3 Preclinical safety Data:

In a two-year bioassay of Levodopa and Carbidopa, no evidence of carcinogenicity was found in rats receiving doses of approximately two times the maximum daily human dose of carbidopa and four times the maximum daily human dose of levodopa.

In reproduction studies with Levodopa and Carbidopa, no effects on fertility were found in rats receiving doses of approximately two times the maximum daily human dose of carbidopa and four times the maximum daily human dose of levodopa.

6. Pharmaceutical Particulars

6.1 List of excipients:

Citric Acid Monohydrate, Disodium EDTATE , Sodium Meta Bisulphite , Micro Crystalline Cellulose, Ethyl Cellulose, Povidone(K 30), Isopropyl Alcohol, Dichloromethane, Colloidal Anhydrous Silica, Micro Crystalline Cellulose, Cross Carmellose Sodium, Talc, Magnesium Stearate

6.2 Incompatibilities:

Not applicable

6.3 Shelf life:

36 Months from the date of Manufacturing.

6.4 Special precautions for storage:

Store below 30°C. Keep medicine away from the reach of children

6.5 Nature and contents of container:

Packing: 10 tablets are packed in ALU/ ALU strip.

Such 3 strips are packed in a printed outer carton along with a pack insert.

7. Marketing Authorization Holder:

Micro Labs Limited

No 27, Race Course Road

Bangalore-560010.

INDIA
