

DERMIDEX

MICONAZOLE CREAM

Description:

Dermidex cream is a smooth, white cream, containing 2.0% w/w Miconazole Nitrate BP.

Pharmacological properties:

Miconazole Nitrate is an imidazole broad spectrum antifungal agent. It exhibits activity against pathogenic fungi (including yeasts and dermatophytes) and gram-positive bacteria.

Pharmacokinetics:

There is little absorption through skin when miconazole nitrate is applied topically.

Uses:

Dermidex is indicated for the treatment of fungal infections of the skin and superficial infections due to gram-positive bacteria. These include athlete's foot, ringworm (tinea infections), intertrigo, candida nappy rash, paronychia, erythrasma, fungal infections of the outer ear and pityriasis versicolor. It may also be used for nail infections.

Directions for use:

Topical application to skin only. Dermidex should be thinly and evenly applied to the affected areas twice daily and rubbed gently. Wash hands thoroughly after use. Treatment should be continued for 10 days after all the lesions have disappeared.

Contra-indications:

Hypersensitivity to any of the ingredients.

Precautions:

Pregnant women should take the advice of a doctor before using dermidex cream. Medical advice should be sought if symptoms persist.

Side-effects:

Rarely patients may experience local irritation immediately after applying the cream. Rarely, local sensitisation or hypersensitivity may occur in which case usage of this product should be stopped.

Storage:

Dermidex cream should be stored below 25°C, in a dry and dark place. Keep out of the reach of children.
